SERVICENOW

Based on observations of service desk agents logging and resolving incidents

Incident Management: Client Script & UI Policy

SCENARIO

Creating, updating, and resolving an incident using client scripts and UI policies

	Entice	Enter	Engage	Exit	Extend
	How does someone initially become aware of this process?	What do agents experience as they begin the process?	In the core moments in the process, what happens?	What do agents experience as the process finishes?	What happens after the experience is over?
Steps What does the agent typically experience?	**Caller reports issue** **Open ServiceNow** **Create new incident**	**Select caller** **Choose category & subcategory** **Enter short description** **Set impact & urgency**	**Client script runs** **UI policy applies** **Show messages** **Assign group & save**	**Submit incident** **Resolve incident** **Caller is notified**	**Review incident data** **Test & refine scripts** **Gather agent feedback**
Interactions What interactions do they have at each step? **People:** Who do they see or talk to? **Places:** Where are they? **Things:** What digital touchpoints do they use?	Phone, email, chat, or self-service portal ServiceNow UI in the browser; agent login Incident > Create New in the left navigator	Caller reference field and user record Category and Subcategory dropdowns Short description and Description fields Impact, Urgency, and Priority fields	onLoad, onChange, onSubmit scripts run in the browser Policy conditions toggle visible, mandatory, read-only Info and error messages on the form Assignment group and Assigned to fields	Save/Submit button; onSubmit script State = Resolved; Close code and Close notes Email notification and portal update	Reports and dashboards Admin works in a sub-production instance Agents and team lead
Goals & motivations At each step, what is the primary goal? ("Help me..." or "Help me avoid...")	Help me capture the problem quickly Help me reach the Incident module fast Help me start with a clean, simple form	Help me find the right person without typos Help me classify the issue correctly Help me avoid missing key details Help me get the right priority without guessing	Help me get instant feedback as I type Help me see only the fields that matter Help me understand exactly what to fix Help me route it to the right team	Help me confirm everything is complete Help me close with the right details Help me keep the caller informed	Help me trust the data Help me avoid breaking the form Help me make the form easier next time
Positive moments What steps does a typical agent find enjoyable, productive, or delightful?	Callers usually describe issues clearly Familiar navigator and filters	Caller details auto-fill and save time Priority calculates from impact and urgency	Instant validation feels smooth Form feels clean and guided Routing is quick once the form is complete	Clear error appears if a field is missing Close fields show only when needed Caller sees updates automatically	Consistent data makes reports reliable Agents notice fewer errors
Negative moments What steps does a typical agent find frustrating, confusing, or time-consuming?	Form loads with many unused fields	Wrong caller picked when names are similar Subcategory lists show unrelated values Descriptions left vague or empty Priority gets set manually and inconsistently	Heavy scripts slow the form load Conflicting policies cause odd behavior Pop-up alerts feel intrusive	Submit blocked with an unclear reason Forgetting close notes, then reopening	Older tickets still have gaps Changes affect every agent at once
Areas of opportunity How might we make each step better? What ideas do we have?	Hide irrelevant fields on load with a UI policy	Client script (onChange) to auto-fill location and flag VIP Client script to filter subcategory by category UI policy: make Short description mandatory UI policy: make Priority read-only	Keep scripts light and use g_form methods Set policy order and review conflicts regularly Use inline field messages instead of alerts	Name the missing field in the message UI policy: mandatory Close code/notes when Resolved	Add a data-quality dashboard Test first and move with update sets Survey agents and iterate
